* Photo Booth: The most common and easiest way to import images into Photoshop is by placing them into a location called the photo booth, which is just a selection of copies of the image you want to use. You can use any of the images and produce a montage of the best bits with the montage tool, which lets you place a picture inside another picture, so you can paste in an image that's a duplicate of a photo or a digital version of a slide you've already scanned in. * Layer window: The layer window is used to manage the different types of layers, which are made of any number of raster images or vector objects that can be moved and re-sized. Layers enable you to re-size, move, and place one object over another, by changing the opacity of the objects. You can manually adjust the opacity of each layer individually by moving the slider in the window. By pressing the Ctrl (Windows) or Cmd (Mac) key and clicking the layer thumbnail, you can lock the layer so it can't be altered, and you can always unhide the layer if it's been hidden. * Editor window: The editor window is used to create, name, save, and work on your image. This is the area where you load, edit, and work on your image. You can work in the painter window, where you draw your own shapes and use existing shapes to create new ones, or use the photo window, where you crop, filter, and tweak existing graphics in the image. You can also apply different modes to the image to help you see all the details of the image and areas you want to work on, or work in the lasso tool (assuming that's the tool you selected in the toolbox window). You can save your work to one of the Photoshop standard image formats, which range from JPG to TIFF to PNG. You can also import images to Photoshop through a web browser. It's pretty easy to do this through the Get External Content and Import Layers dialogs on the Photoshop menu bar. Select the image you want to import and click Get External Content. Then drag that image, either directly into the image window or into the photo booth, or use the Import Layers dialogs to import multiple photos at once. You can download a free reader to view, edit, and make any kind of changes to the images you're importing

The present invention relates to the use of hydroxypropylmethylcellulose ether with ester acrylate polymers as a binder in an aerosol paint formulation. More particularly, it relates to the use of a combination of hydroxypropylmethylcellulose ether with ester acrylate polymers as a binder in an aerosol paint formulation wherein the combination of hydroxypropylmethylcellulose ether and ester acrylate polymers is used as both a solvent and a binder. Powder paints are widely used in a variety of industries, such as the automobile, appliance, and tool and die, and for both exterior and interior uses. The largest volume of powder paint is used in the automotive and appliance industries, which currently account for about 98% of the total powder paint used by consumers. Powder coatings are based on the intramolecular polymerization of a polyfunctional acrylic monomer in the presence of suitable catalysts and crosslinking agents. The most important feature of powder paints is that they can be applied to the substrate, for example, by electrostatic spraying or by air spraying. The spraying technique is economical, the coating process is simple and fast, the coating can be applied to inaccessible surfaces, and the powder coating has excellent properties. The usual powder paints are thermoplastic resins which are not cured until the powder is heated just before application. On being heated, the film is plasticized and the resultant film is an amorphous, non-crosslinked coating. The powder is then applied to the substrate, where it is melted by conduction into the substrate. The powder paints used in the automotive and appliance industries are usually based on polymeric acrylic resins. The thermosetting acrylic resins, however, have an upper temperature, beyond which the films are generally not capable of being plasticized. Therefore, the acrylic resin-based powders can only be applied at temperatures below the upper limit. To increase the upper limit, the acrylic resins are usually mixed with one or more powdered organic solvents, which act as plasticizers and can be applied at high temperatures. Several problems have prevented the widespread use of powder paints. The major drawback of using solvent powder paints is the fact that the solvents evaporate over a short period of time and leave a film which is not acceptable for many applications, such as kitchen and bathroom enameling. As a result of these and other problems, it is desirable to use
