Category:Computer-aided design softwareQ: How to use google map v2 in android? How to use google map v2 in android? I want to integrate it with my android application. When I try to build my code it says Error:Execution failed for task ':app:dexDebug'. com.android.ide.common.process.ProcessException: org.gradle.process.internal.ExecException: Process 'command 'C:\Program Files\Java\jdk1.7.0_45\bin\java.exe'' finished with non-zero exit value 2 I try to solve this question by stack overflow but it doesn't solve my problem A: I don't know which Android AVD or emulator you are using, so I am writing a general answer. I had exactly the same issue recently. Error "Error:Execution failed for task ':app:dexDebug'. Cause: android.support.v7.widget.Toolbar with AppCompat v21 (or above) doesn't work with pre 21 Android versions." What I tried was to use Android Support Library 25.0.0 and Support Toolbar 22.2.0. It worked!! Everything is based on Google's design guidelines, but they are outdated. Today, the latest version for Material Design is Android Design library. The present invention generally relates to fabrication of semiconductor devices and more specifically to a method for fabricating a capacitor structure. DRAMs are built using capacitors that act as the memory element. A unit cell of a capacitor structure comprises a capacitor and an access transistor. A DRAM capacitor is typically fabricated in the form of a trench in an oxide substrate. The access transistor is built above the capacitor, connected to the capacitor, by a gate. Multiple DRAMs are typically formed on a single substrate and may be interconnected to form a memory bank. The potential advantages of the high circuit density, high signal level and low power consumption of DRAMs in combination with the economic feasibility of large scale semiconductor wafer processing has rendered the DRAM cell one of the most commercially successful semiconductor devices. As DRAMs evolve, efforts are underway to increase storage density and reduce costs. One DRAM storage structure that has been proposed is the use of a container capacitor. A container capacitor is a stacked capacitor having an inner and an outer capacitor electrode, separated by 570a42141b
